# Why do we want to edit LLMs?

# Why do we want to edit LLMs?

- improve performance on downstream tasks
- mitigate biases or unwanted behavior
- align models with human preferences
- update models with new information

# The notion of task vectors

$$\tau = \theta_{ft} - \theta_{pre}$$

$$\theta_{\text{new}} = \theta + \tau$$

*In practice, we have an optional scaling term  $\lambda$*

$$\theta_{\text{new}} = \theta + \lambda\tau$$

# Forgetting via negation

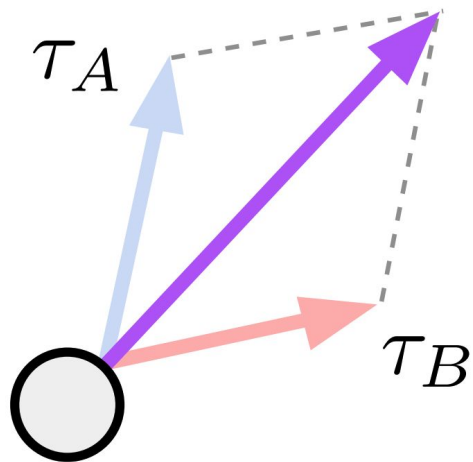

Example: making a language model produce less toxic content

$$\theta_{\text{new}} = \theta - \tau = \theta - (\theta_{ft} - \theta)$$

*In practice, we have an optional scaling term  $\lambda$*

# Learning via addition

$$\tau_{\text{new}} = \tau_A + \tau_B$$

Example: building a multi-task model

$$\begin{aligned}\theta_{\text{new}} &= \theta + \tau = \theta + (\tau_A + \tau_B) \\ &= \theta + (\theta_A - \theta) + (\theta_B - \theta)\end{aligned}$$

*In practice, we have optional scaling terms  $\lambda_A, \lambda_B$*

# Task analogies

$$\tau_{\text{new}} = \tau_C + (\tau_B - \tau_A)$$

Example: improving domain generalization

*"A is to B as C is to D"*

$$\tau_B - \tau_A = \tau_D - \tau_C$$

$$\tau_D = \tau_C + (\tau_B - \tau_A)$$

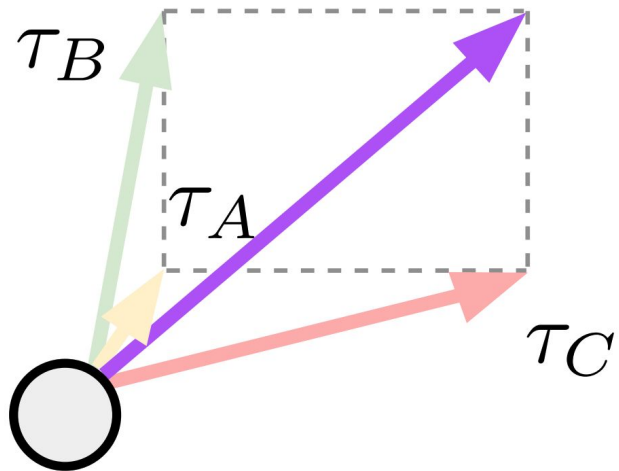

$$\theta_{\text{new}} = \theta + \tau_C + (\tau_B - \tau_A)$$

$$= \theta + (\theta_C - \theta) + (\theta_B - \theta) - (\theta_A - \theta)$$

*In practice, we have optional scaling terms  $\lambda_{A'}$   $\lambda_{B'}$   $\lambda_C$*

# Task analogies

$$\tau_{\text{new}} = \tau_C + (\tau_B - \tau_A)$$

Example: improving domain generalization

*"A is to B as C is to D"*

$$\tau_B - \tau_A = \tau_D - \tau_C$$

$$\tau_D = \tau_C + (\tau_B - \tau_A)$$

$$\theta_{\text{new}} = \theta + \tau_C + (\tau_B - \tau_A)$$

$$= \theta + (\theta_C - \theta) + (\theta_B - \theta) - (\theta_A - \theta)$$

*In practice, we have optional scaling terms  $\lambda_{A'}$   $\lambda_{B'}$   $\lambda_C$*

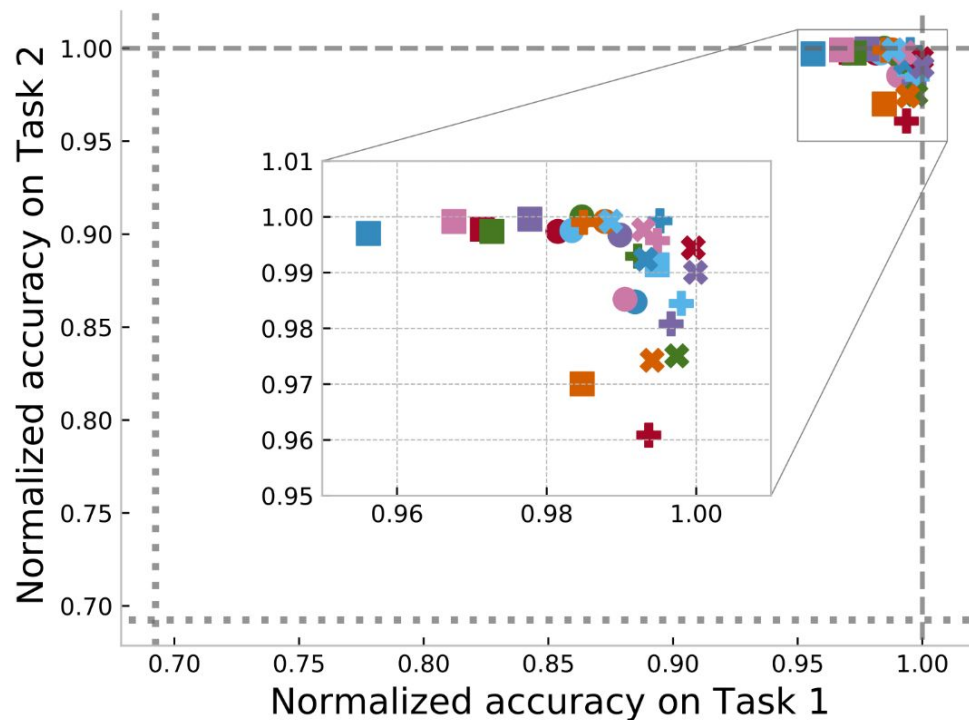

# Forgetting image classification tasks via negation

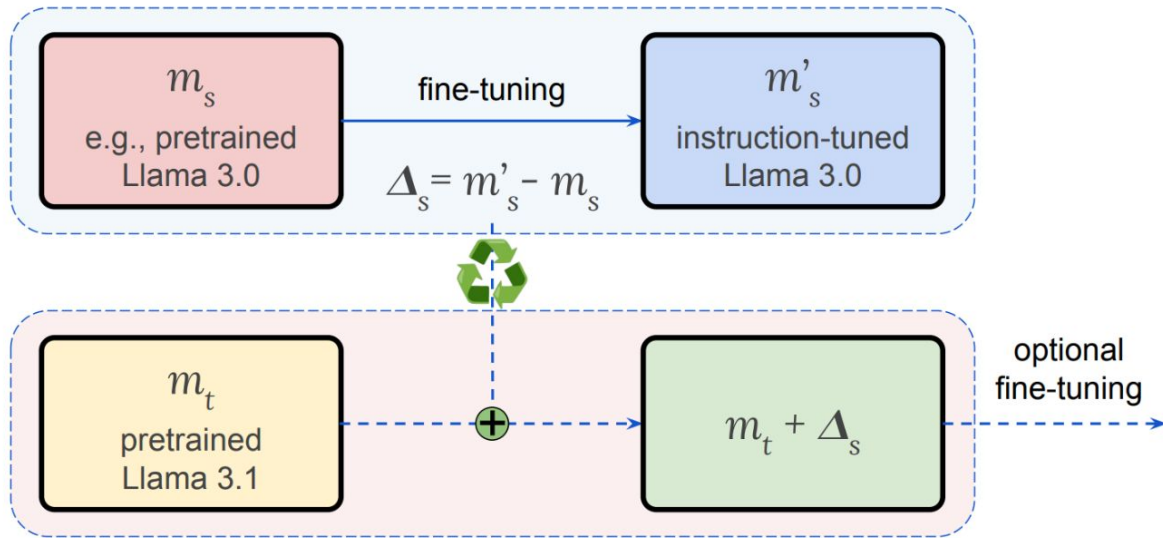

Figure 1: To transfer fine-tuning (e.g., instruction tuning) from a *source* model version  $s$  (e.g., Llama 3.0) to a *target* version  $t$  (Llama 3.1), we first compute the diff vector  $\Delta_s = m'_s - m_s$  from version  $s$ , where  $m'_s$  is the fine-tuned model (instruction-tuned Llama 3.0) and  $m_s$  is the base model (pretrained Llama 3.0). Then, we add  $\Delta_s$  to the target base model (pretrained Llama 3.1) to approximate the fine-tuned model in version  $t$  (instruction-tuned Llama 3.1). We explore two scenarios: (1) *recycling*—transferring from an older model version to a newer one to reduce retraining, and (2) *backporting*—transferring from a newer version to an older one to take advantage of the newer fine-tuning while maintaining optimization for specific use cases.

# Transferring fine-tuning updates

| Model                            | GSM8K       | MATH        | ARC <sub>C</sub> | GPQA        | MMLU        | IFEval      |
|----------------------------------|-------------|-------------|------------------|-------------|-------------|-------------|
| Llama 3.0 8B Instruct            | 81.1        | 28.8        | 82.4             | <b>31.5</b> | 64.9        | <b>76.6</b> |
| Llama 3.0 8B<br>+ $\Delta_{3.1}$ | <b>82.8</b> | <b>44.7</b> | <b>83.0</b>      | 25.9        | <b>70.0</b> | <b>76.6</b> |
| Llama 3.1 8B Instruct            | <b>86.5</b> | <b>50.3</b> | <b>83.8</b>      | 31.3        | <b>72.9</b> | 80.5        |
| Llama 3.1 8B<br>+ $\Delta_{3.0}$ | 56.6        | 19.3        | 79.2             | 21.9        | 66.8        | 36.4        |
|                                  | 79.8        | 29.9        | 82.9             | <b>32.6</b> | 65.1        | <b>83.3</b> |

Table 1: Fine-tuning transfer significantly improves the performance of the target base model across various tasks, achieving results comparable to its fine-tuned counterpart in many cases. Here,  $\Delta_{3.0}$  and  $\Delta_{3.1}$  represent the diff vectors between Llama Instruct and Llama for versions 3.0 and 3.1, respectively. **Notably, adding the diff vector  $\Delta_s$  from a different model version can effectively transform a non-instruction-tuned model (e.g., Llama 3.0 or Llama 3.1) into one that follows instructions well (Llama 3.0 +  $\Delta_{3.1}$  or Llama 3.1 +  $\Delta_{3.0}$ ) without further training.** Additional results for OLMo and Tulu can be found in Appendix A, **where we additionally find that advanced LLM capabilities, attained through alignment tuning stages such as Supervised Fine-Tuning (SFT), Direct Preference Optimization (DPO), or Group Relative Policy Optimization (GRPO), can be successfully transferred across different model versions.**

# Linear mode connectivity

|                       | $\mathcal{M}_1$ | $\mathcal{M}_2$ | $\mathcal{M}_3$ | $\mathcal{M}_4$ | $\mathcal{M}_5$ |
|-----------------------|-----------------|-----------------|-----------------|-----------------|-----------------|
|                       | 13.2            | 19.4            | 24.4            | 64.5            | 65.5            |
| + $\Delta_1$          |                 | <b>26.6</b>     | 32.0            | 27.5            | 19.6            |
| + $\Delta_2$          | <b>19.0</b>     |                 | <b>39.8</b>     | 25.9            | 17.3            |
| + $\Delta_3$          | 14.3            | 25.0            |                 | 68.6            | 70.3            |
| + $\Delta_4$          | 11.8            | 18.0            | 22.6            |                 | <b>77.1</b>     |
| + $\Delta_5$          | 11.9            | 16.0            | 24.0            | <b>72.9</b>     |                 |
| FT( $\mathcal{M}_i$ ) | 45.1            | 50.7            | 60.4            | 75.7            | 75.5            |

Table 3: GSM8K accuracies indicating that more powerful models are better at leveraging transferred fine-tuning. Effective use of transferred fine-tuning only emerges once the target base model reaches a certain level of capability. Furthermore, fine-tuning transfer works best when the source and target models are close within a linearly connected region of the parameter space. Here,  $\mathcal{M}_i$  represents different intermediate pretrained checkpoints of OLMo 2 7B (with smaller values of  $i$  indicating earlier checkpoints), and  $\Delta_i$  refers to the diff vector resulting from the fine-tuning of version  $i$ . FT( $\mathcal{M}_i$ ) denotes applying fine-tuning directly to  $\mathcal{M}_i$ . See Table 11 in Appendix C for MATH500 results.

# Multilingual model development

| Model                 | Malagasy    | Sinhala     | Turkish     |
|-----------------------|-------------|-------------|-------------|
| Llama 3.0 8B Instruct | 23.1        | 23.3        | 30.8        |
| + FT                  | 30.8        | 29.0        | 43.2        |
| Llama 3.1 8B Instruct | 27.6        | <b>33.0</b> | 27.7        |
| + $\Delta_{3.0}$      | <b>32.3</b> | 32.3        | <b>43.2</b> |

Table 2: Recycling fine-tuning updates improves multilingual performance on Global MMLU without re-training, yielding a 4.7% and 15.5% absolute improvement for Malagasy and Turkish, respectively, compared to Llama 3.1 8B Instruct.  $\Delta_{3.0}$  represents the diff vector between Llama 3.0 Instruct and its monolingual fine-tuned (FT) version.

# What Matters for Model Merging at Scale?

**Prateek  
Yadav**

**Tu Vu**

**Jonathan Lai**

**Alexandra  
Chronopoulou**

**Manaal Faruqi**

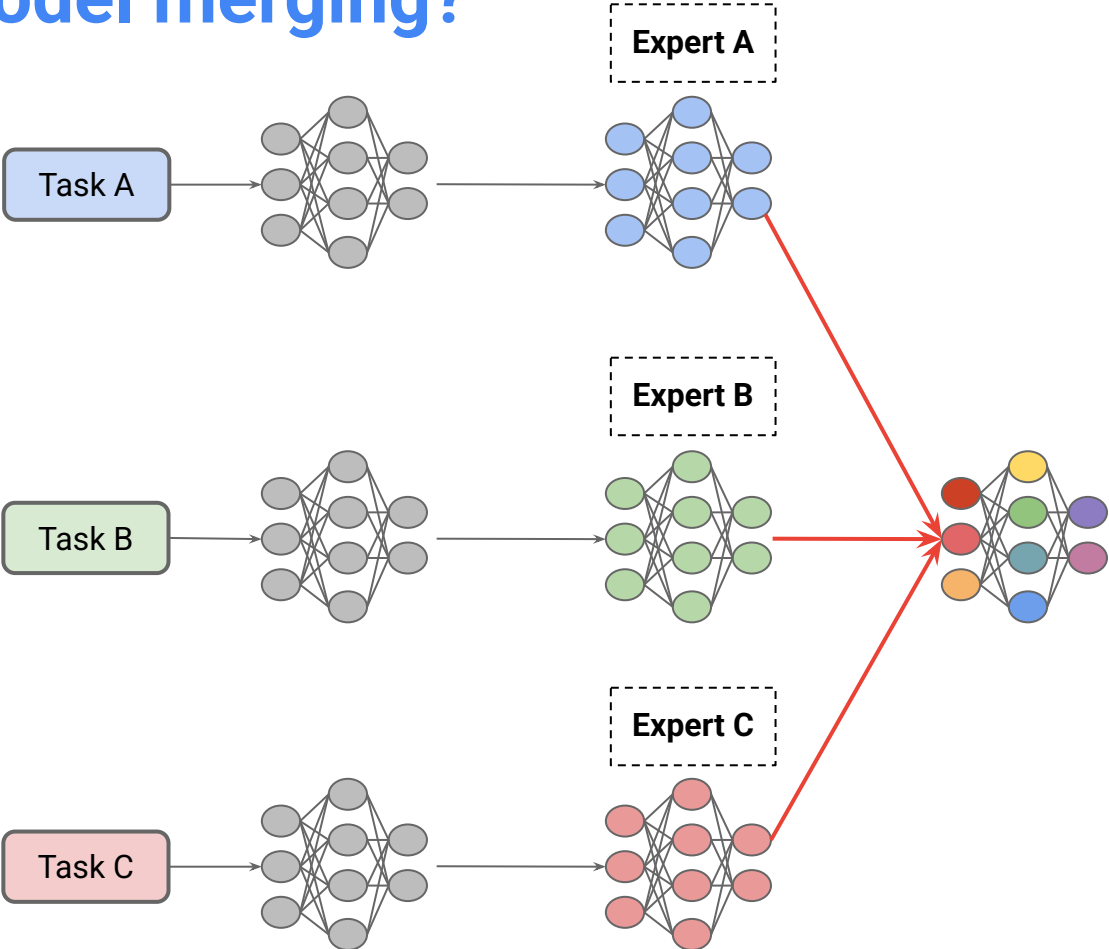

**Mohit Bansal**

**Tsendsuren  
Munkhdalai**

# What is model merging?

# Why model merging?

- dramatically reduces storage and serving costs by reusing a single model across tasks
- enables compositional combination of capabilities from expert models, which can improve generalization to novel tasks
- supports decentralized and modular model development by allowing multiple contributors to independently build models and later combine them together

# Limitations of prior work

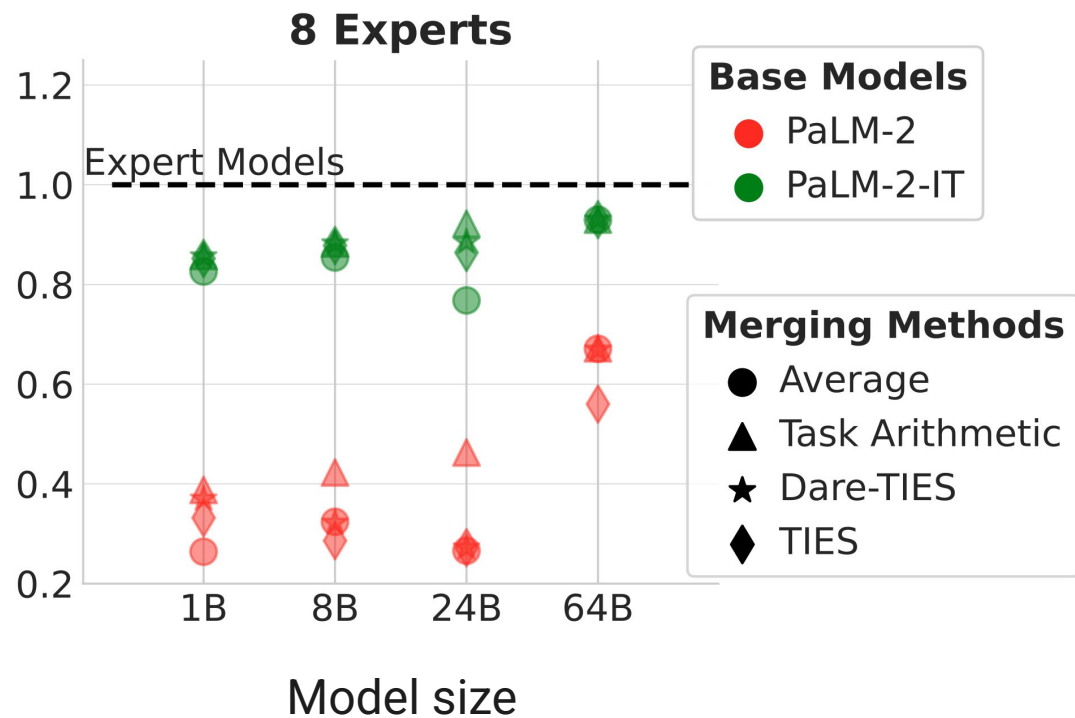

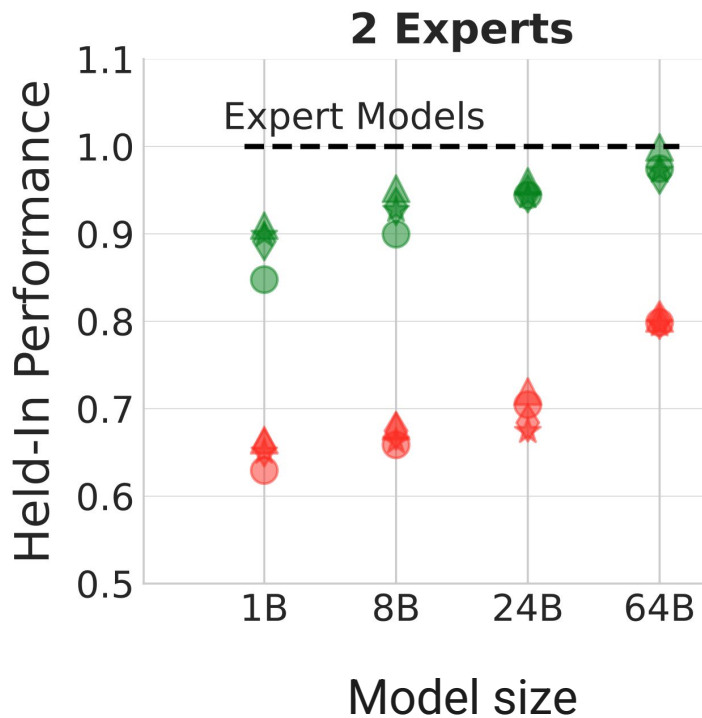

- Typically merges small or moderately-sized models (up to 7B parameters)
- Typically merges only 2-3 models
- Largely focuses on improving “**held-in**” performance on tasks the expert models were trained for

# A large-scale empirical study

- 4 important factors
  - **model size**
    - 1B, 8B, 24B, 64B
  - **base model quality**
    - Pre-trained model (**PaLM**) vs. Instruction-tuned (**PaLM-IT**)
  - **merging method**
    - Average, Task Arithmetic / Task Vectors, TIES, DARE-TIES
  - **number of experts**
    - 2, 4, 6, 8
- Their impact on
  - **Held-In** performance
  - Zero-shot (**Held-Out**) generalization

# Instruction-tuned models facilitate easier merging

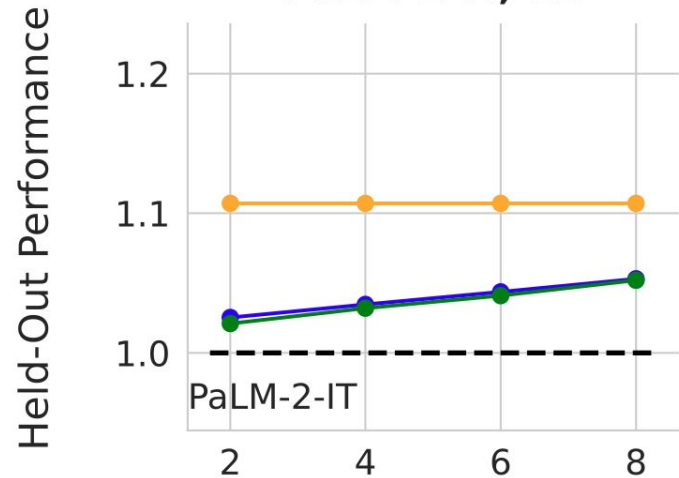

# Bigger models are easier to merge

# Merging boosts zero-shot generalization

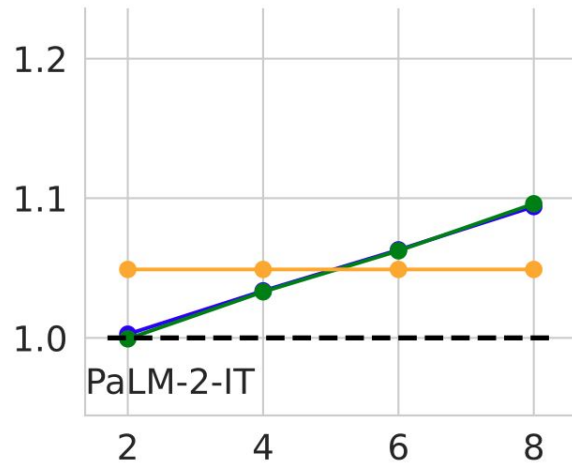

## PaLM-2-IT, 1B

## PaLM-2-IT, 24B

## PaLM-2-IT, 64B

# of Experts

### Merging Method

- Task Arithmetic
- TIES
- Multitask

# Merging boosts zero-shot generalization (cont.)

# Bigger model sizes can merge more experts

(a) Merging 2 experts, Held-In.

(b) Merging 8 experts, Held-In.

# Bigger model sizes can merge more experts (cont.)

# At large scales, merging methods converge

**Thank you!**
